

Recent Changes

The AviationWeather Data API has been redeveloped in 2025. These improvements are intended to continue to deliver the same data with more consistent and streamlined services and documentation. External interfaces have been designed to retain compatibility where possible however some adjustment may be required depending on specific endpoints and options used that may have been used previously. Users of the previous API should take a moment to review the new specifications and major changes outlined below.

- [OpenAPI specification](#)

All endpoints

- Errors with status code 400 returned for invalid input parameters
- Errors are available in plain text, JSON, and XML format
- Status code 204 returned for valid requests with no data available (except GeoJSON)
- Dates not in specific format like epoch time are returned in ISO8601 format (i.e. yyyyymmddThh:mm:ss.sssZ)
- Undocumented options have been removed

/cgi-bin

- **Unsupported — replaced by /api/data**
- All references to cgi-bin have been removed and will no longer work
- Nearly all of the same services and options remain available through /api endpoints
- For example /cgi-bin/data/metar.php?ids=KSFO may be changed to /api/data/metar?ids=KSFO

/api/data/airport

- id property removed from JSON output

/api/data/airsigmet

- HTML format output removed
- GeoJSON format output added
- airSigmetId property removed from JSON output
- Query parameters for top, bottom, types, and loc removed

/api/data/cwa

- HTML format output removed
- GeoJSON format output added
- cwald property removed from JSON output
- Query parameters for top, bottom, and cwsu removed

/api/data/dataserver

- *Deprecated — most functionality unchanged however users are encouraged to migrate to product specific endpoints*
- TAF CSV format removed

/api/data/gairmet

- HTML format output removed
- forecastId and geometryId properties removed from JSON output
- id property removed from GeoJSON output
- Query parameters for level, top, and bottom removed

/api/data/isigmet

- HTML format output removed
- isigmetId property removed from JSON output
- id property removed from GeoJSON output

- Query parameters for top and bottom removed

/api/data/metar

- HTML format output removed
- OVX returns vertical visibility as cloud base instead of zero
- metar_id property removed from JSON output
- id property removed from GeoJSON output
- Add fltCat property to JSON output
- Add clouds array to GeoJSON properties to match JSON output
- Remove individual cloud properties from GeoJSON
- Query parameters for recent, order, vfr, output, filter, and fields removed

/api/data/mis

- JSON format output added

/api/data/pirep

- pirepld property removed from JSON output
- id property removed from GeoJSON output
- Add clouds array to JSON and GeoJSON properties
- Remove individual cloud properties from JSON and GeoJSON
- Query parameters for order removed

/api/data/stationinfo

- No changes

/api/data/taf

- HTML format output removed
- Query parameters for recent, order, vfr, tempo, output, and filter removed

/api/data/tcf

- New API dataset
- TFM Convective Forecast in raw text and GeoJSON

/api/json

- ***Unsupported — replaced by GeoJSON services under /api/data***
- For example /api/json/MetarJSON is replaced by /api/data/metar?format=geojson

Cache files

- Cache files use the same data as the API and thus have the same changes as above
- TAF CSV files have been discontinued
